ABSTRACT

During April and May 1991 the R/V New Horizon made a detailed study of the flow and thermohaline structures around Fieberling and neighboring seamounts as part of a multi-investigator, multi-institutional ONR sponsored Flow over Abrupt Topography Accelerated Research Initiative. A total of 122 stations were taken in the working area and 2 test stations were taken outside it. This report gives a numerical and graphical summary of the CTD field measurements and of surface meteorological observations.

INTRODUCTION

A. Sea floor topography

Fieberling is a large seamount 992 km west of San Diego, CA (Figure 1). It rises abruptly from the deep ocean floor at 4300 m to a minimum depth of 438 m. To the ESE of Fieberling are three smaller seamounts: Fieberling II, 52 km distant with a minimum depth of 1040 m; Hoke, 88 km distant with a least depth of 772 m; and Stoddard, 164 km distant with a minimum depth of 1070 m. The four seamounts form a linearly arranged group, which will be referred to as the Fieberling group. The basic dimensions of the four seamounts and of the gaps between them are summarized in Table 1. It is important to note that Fieberling seamount is isolated from its neighbors only in the upper fifth of the water column. Below 2000 m, the gaps between Fieberling, Fieberling II and Hoke are less than the width of the seamounts involved. This seafloor shape has fundamental consequences for flow-topography interaction. While the upper layer flow interacts directly with a single seamount (Fieberling), the deep flow interacts with the seamount group.

B. Objectives of CTD study

To investigate the effects of the Fieberling and neighboring seamounts on oceanic flow and property structures in their vicinity, a detailed field study was made of the environmental conditions in the area aboard the R/V New Horizon between 24 April and 11 May 1991. The main objectives of this study were to:

- determine the structure of the large scale flow impinging upon Fieberling seamount and its change with depth,
- 2. study the effects of neighboring seamounts on the circulation near Fieberling,
- 3. investigate the characteristics of jets and eddies near seamounts and seamount wakes,

- 4. assess the structure and extent of upwelling cones above the summits of seamounts,
- 5. determine the time variability of the spatial structures over a period of one week.
- C. Cruise track, station positions and meteorological observations.

The field study focused on a 110 km by 170 km area centered around the WNW-ESE axis of the seamounts. The basic station grid was 27 km, with closer station spacing near the seamounts. The station pattern in the working area is shown in Figure 2 and consisted of 122 CTD stations. Fifty-nine stations were occupied twice in order to determine the time change over a week. In addition, two instrument test stations were taken, one at 32°32' N, 118°00' W (station 0) shortly after leaving San Diego and one at 32°30' N, 126°00' W (station 123) shortly after leaving the working area. At all stations, records were kept of atmospheric pressure, wind speed and direction as well as of dry and wet bulb temperatures.

TABLE 1. Basic Dimensions of Seamounts in the Fieberling Group. Widths are approxiamate. Heights are relative to a seafloor base at 4300 m.

Seamounts:	Fieberling	Fieberling I	Hoke Hoke	Stoddard
Latitude	32°26.1'N	32°16.1'N	32°05.7'N	31°45.6'N
Longitude	127 ° 45.9'W	127°15.1'W	126°55.5'W	126°13.8'W
Minimun depth	438 m	1048 m	772 m	1075 m
Height above seafloor	3862 m	3252 m	3528 m	3225 m
Width at 500 m	3 km	-	_	_
Width at 1000 m	12 km	_	4 km	_
Width at 1500 m	16 km	6 km	8 km	3 km
Width at 2000 m	20 km	8 km	9 km	8 km
Width at 4000 m	40 km	22 km	30 km	22 km
Gap at 1500 m		41 km	32 km	68 km
Gap at 2000 m	;	35 km	26 km	61 km
Gap at 4000 m	:	20 km	11 km	35 km

ACKNOWLEDGMENTS

Captain Eric Buck and his officers and men are to be commended for outstanding performance. The high professional competence of the seagoing personnel from the Oregon State University (OSU), the Scripps Institution of Oceanography (SIO), the Skidaway Institute of Oceanography (Skidaway IO) and the University of Washington (UW) made this report possible. This report was supported by ONR grant N00014-89-J-1248.

DATA ACQUISITION AND CALIBRATION

The CTD casts were conducted using the University of Washington's Seabird Conductivity-Temperature-Pressure profiler, coupled to a SeaTech Transmissometer (25 cm pathlength) and a General Oceanics 24 bottle rosette sampler. A 12 kHz pinger was mounted in the CTD frame to allow a safe approach to the bottom.

The conductivity, temperature and pressure sensors were calibrated before and after the cruise by Seabird. The pressure sensor required no correction. For temperature and conductivity the following corrections were applied:

Temperature: T'(corr) = T'(raw) - 0.00350 Celsius

Conductivity: C(corr) = C(raw) + 0.000174 Siemens/m

The salinities derived from the corrected CTD conductivities, temperatures and pressures were compared to the salinities derived from the shipboard Guildline Autosal instrument. The CTD salinities agreed with the Autosal water bottle salinities within 0.003 per mille. No further corrections were applied.

The transmissometer was calibrated by SeaTech before the cruise. The instrument was damaged beyond repair at station 25, so no post cruise calibration could be made to determine the instrument drift. Comparison with light transmission data obtained in 1989 in the same area showed a systematic positive offset of one percent at all depths in 1991. This offset has been removed from the data. The profiles of light transmission exhibited some electronic jitter with amplitudes not exceeding 0.2 %. In order to eliminate the jitter, the light transmission profiles were smoothed with a 21 point binomial filter. No further corrections were applied.

The conductivity, temperature, pressure and light transmission data were digitized at 2 dbar intervals. These data formed the basis for all subsequent calculations.
